Filter-Based Packet Forwarding ECA Policy  
draft-hares-i2rs-pkt-eca-data-model-00.txt

## Abstract

This document describes the yang data model for packet forwarding policy that filters received packets and forwards (or drops) the packets. Prior to forwarding the packets out other interfaces, some of the fields in the packets may be modified. If one considers the packet reception an event, this packet policy is a minimalistic Event-Match Condition-Action policy. This policy controls forwarding of packets received by a routing device on one or more interfaces on which this policy is enabled. The policy is composed of an ordered list of policy rules. Each policy rule contains a set of match conditions that filters for packets plus a set of actions to modify the packet and forward packets. The match conditions can match tuples in multiple layers (L1-L4, application), interface received on, and other conditions regarding the packet (size of packet, time of day). The modify packet actions allow for setting things within the packet plus decapsulation and encapsulation packet. The forwarding actions include forwarding via interfaces, tunnels, or nexthops and dropping the packet. The policy model can be used with the session ephemeral (BGP Flow Specifications), reboot ephemeral state (I2RS ephemeral), and non-ephemeral routing/forwarding state (e.g. configuration state ).

## Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on July 29, 2016.

## 1. Introduction

This document describes the yang data model for packet forwarding policy that filters received packets and forwards (or drops) the packets. Prior to forwarding the packets out other interfaces, some of the fields in the packets may be modified. If one considers the reception of a packet as an event, this minimalistic Event-Match Condition-Action policy. If one considers the reception of packets containing Layer 1 to Layer 4 + application data a single packet, then this minimalistic policy can be called a packet-only ECA policy. This document will use the term packet-only ECA policy for this model utilizing the term "packet" in this fashion.

This packet-only ECA policy data model supports an ordered list of ECA policy rules where each policy rule has a name. The match condition filters include matches on

- o packet headers for layer 1 to layer 4,
- o application protocol data and headers,
- o interfaces the packet was received on,
- o time packet was received, and
- o size of packet.

The actions include packet modify actions and forwarding options. The modify options allow for the following:

- o setting fields in the packet header at Layer 2 (L2) to Layer 4 (L4), and
- o encapsulation and decapsulation the packet.

The forwardingng actions allow forwardsing the packet via interfaces, tunnels, next-hops, or dropping the packet. setting things within the packet at Layer 2 (L2) to layer 4 (L4) plus overlay or application data.

The first section of this draft contains an overview of the policy structure. The second provides a high-level yang module. The third contains the yang module.

### 1.1. Definitions and Acronyms

INSTANCE: Routing Code often has the ability to spin up multiple copies of itself into virtual machines. Each Routing code instance or each protocol instance is denoted as Foo\_INSTANCE in the text below.

NETCONF: The Network Configuration Protocol

PCIM - Policy Core Information Model

RESTconf - http programmatic protocol to access yang modules

### 1.2. Antecedents this Policy in IETF

Antecedents to this generic policy are the generic policy work done in PCIM WG. The PCIM work contains a Policy Core Information Model (PCIM) [RFC3060], Policy Core Informational Model Extensions [RFC3460] and the Quality of Service (QoS) Policy Information Model (QPIM) ([RFC3644]) From PCIM comes the concept that policy rules which are combined into policy groups. PCIM also refined a concept

of policy sets that allowed the nesting and aggregation of policy groups. This generic model did not utilize the concept of sets of groups, but could be expanded to include sets of groups in the future.

## 2. Generic Route Filters/Policy Overview

This generic policy model represents filter or routing policies as rules and groups of rules.

The basic concept are:

### Rule Group

A rule group is is an ordered set of rules .

### Rule

A Rule is represented by the semantics "If Condition then Action". A Rule may have a priority assigned to it.

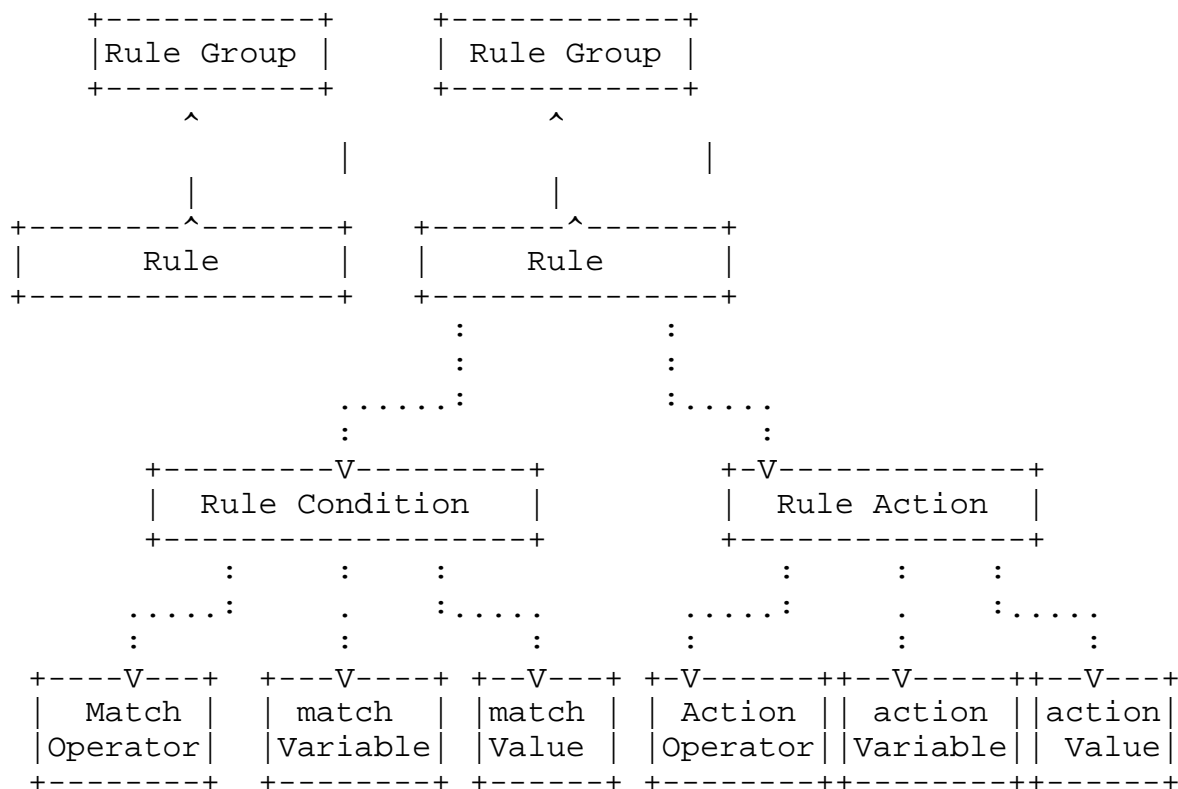

Figure 1: ECA rule structure

### 3. BNP Rule Groups

The pkt ECA policy is an order set of pkt-ECA policy rules. The rules assume the event is the reception of a packet on the machine on a set of interfaces. This policy is associated with a set of interfaces on a routing device (physical or virtual).

A Rule group allows for the easy combination of rules for management stations or users. A Rule group has the following elements:

- o name that identifies the grouping of policy rules
- o module reference - reference to a yang module(s) in the yang module library that this group of policy writes policy to
- o list of rules

Rule groups may have multiple policy groups at specific orders. For example, policy gorup 1 could have three policy rules at rule order 1 and four policy rules at rule order 5.

The rule has the following elements: name, order, status, priority, reference cnt, and match condition, and action as shown as shown in figure 2. The order indicates the order of the rule within the the complete list. The status of the rule is (active, inactive). The priority is the priority within a specific order of policy/filter rules. A reference count (refcnt) indicates the number of entities (E.g. network modules) using this policy. The generic rule match-action conditions have match operator, a match variable and a match value. The rule actions have an action operator, action variable, and an action value.

Rules can exist with the same rule order and same priority. Rules with the same rule order and same priority are not guaranteed to be at any specific ordering. The order number and priority have sufficient depth that administrators who wish order can specify it.

## 4. BNP Generic Info Model in High Level Yang

Below is the high level inclusion

Figure 5

## 6. IANA Considerations

This draft requests IANA Assign a urn in the IETF yang module space for:

```
"urn:ietf:params:xml:ns:yang:ietf-pkt-eca-policy";

associated prefix "pkt-eca";
```

## 7. Security Considerations

These generic filters are used in the I2RS FB-RIBs to filter packets in a traffic stream, act to modify packets, and forward data packets. These I2RS filters operate dynamically at same level as currently deployed configured filter-based RIBs to filter, change, and forward traffic. The dynamic nature of this protocol requires that I2RS Filters track the installer of group information and rules.

This section will be augmented after a discussion with security experts.
