The ARIA Algorithm and Its Use with the Secure Real-time Transport
Protocol(SRTP)
draft-ietf-avtcore-aria-srtp-07

Abstract

This document defines the use of the ARIA block cipher algorithm within the Secure Real-time Transport Protocol (SRTP) for providing confidentiality for the Real-time Transport Protocol (RTP) traffic and for the control traffic for RTP, the RTP Control Protocol (RTCP). It details three modes of operation (CTR, CCM, GCM) and a SRTP Key Derivation Function for ARIA.

1. Introduction

This document defines the use of the ARIA [RFC5794] block cipher algorithm in the Secure Real-time Transport Protocol (SRTP) [RFC3711] for providing confidentiality for the Real-time Transport Protocol (RTP) [RFC3550] traffic and for the control traffic for RTP, the RTP Control Protocol (RTCP) [RFC3550].

1.1. ARIA

ARIA is a general-purpose block cipher algorithm developed by Korean cryptographers in 2003. It is an iterated block cipher with 128-, 192-, and 256-bit keys and encrypts 128-bit blocks in 12, 14, and 16 rounds, depending on the key size. It is secure and suitable for most software and hardware implementations on 32-bit and 8-bit processors. It was established as a Korean standard block cipher algorithm in 2004 [ARIAKS] and has been widely used in Korea, especially for government-to-public services. It was included in PKCS #11 in 2007 [ARIAPKCS]. The algorithm specification and object identifiers are described in [RFC5794].

1.2. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119].

2. Cryptographic Transforms

Block ciphers ARIA and AES share common characteristics including mode, key size, and block size. ARIA does not have any restrictions for modes of operation that are used with this block cipher. We define three modes of running ARIA within the SRTP protocol, (1) ARIA in Counter Mode (ARIA-CTR), (2) ARIA in Counter with CBC-MAC Mode (ARIA-CCM) and (3) ARIA in Galois/Counter Mode (ARIA-GCM).

2.1. ARIA-CTR

Section 4.1.1 of [RFC3711] defines AES-128 counter mode encryption, which it refers to as "AES_CM". Section 2 of [RFC6188] defines "AES_192_CM" and "AES_256_CM" in SRTP. ARIA counter modes are defined in the same manner except that each invocation of AES is replaced by that of ARIA [RFC5794], and are denoted by ARIA_128_CTR, ARIA_192_CTR and ARIA_256_CTR respectively, according to the key lengths. The plaintext inputs to the block cipher are formed as in AES-CTR(AES_CM, AES_192_CM, AES_256_CM) and the block cipher outputs are processed as in AES-CTR.

When ARIA-CTR is used, it MUST be used only in conjunction with an authentication function. The ARIA-CTR crypto suites with HMAC-SHA1 as an authentication function are listed below. The authentication key length of all crypto suites is 20 octets.

Section 3.2 of [RFC6904] defines AES-CTR for SRTP header extension keystream generation. When ARIA-CTR is used, the header extension keystream SHALL be generated in the same manner except that each invocation of AES is replaced by that of ARIA [RFC5794].

2.2. ARIA-GCM

GCM (Galois Counter Mode) [GCM][RFC5116] is an AEAD (Authenticated Encryption with Associated Data) block cipher mode. A detailed description of ARIA-GCM is defined similarly as AES-GCM found in [RFC5116][RFC5282].

The document [I-D.ietf-avtcore-srtp-aes-gcm] describes the use of AES-GCM with SRTP [RFC3711][RFC6904]. The use of ARIA-GCM with SRTP is defined the same as that of AES-GCM except that each invocation of AES is replaced by ARIA [RFC5794]. When [RFC6904] is in use, a separate keystream to encrypt selected RTP header extension elements MUST be generated in the same manner defined in [I-D.ietf-avtcore-srtp-aes-gcm] except that AES-CTR is replaced by ARIA-CTR.

The ARIA-GCM algorithms in Table 8 may be used with SRTP and SRTCP:

Name	Enc. Key Length	Auth. Tag Length
AEAD_ARIA_128_GCM	16 octets	16 octets
AEAD_ARIA_256_GCM	32 octets	16 octets

2.3. ARIA-CCM

CCM (Counter with CBC-MAC) [RFC3610][RFC5116] is another AEAD block cipher mode. A detailed description of ARIA-CCM is defined similarly as AES-CCM found in [RFC5116] [RFC6655] [I-D.ietf-avtcore-srtp-aes-gcm].

The document [I-D.ietf-avtcore-srtp-aes-gcm] describes the use of AES-CCM with SRTP [RFC3711][RFC6904]. The use of ARIA-CCM with SRTP is defined the same as that of AES-CCM except that each invocation of AES is replaced by ARIA [RFC5794]. When [RFC6904] is in use, a separate keystream to encrypt selected RTP header extension elements MUST be generated in the same manner defined in [I-D.ietf-avtcore-srtp-aes-gcm] except that AES-CTR is replaced by ARIA-CTR.

The ARIA-CCM algorithms in Table 13 may be used with SRTP and SRTCP:

Name	Enc. Key Length	Auth. Tag Length
AEAD_ARIA_128_CCM	16 octets	16 octets
AEAD_ARIA_256_CCM	32 octets	16 octets

3. Key Derivation Functions

Section 4.3.3 of [RFC3711] defines the AES-128 counter mode key derivation function, which it refers to as "AES-CM PRF". Section 3 of [RFC6188] defines the AES-192 counter mode key derivation function and the AES-256 counter mode key derivation function, which it refers

to as "AES_192_CM_PRF" and "AES_256_CM_PRF" respectively. The ARIA-CTR PRF is defined in a same manner except that each invocation of AES replaced by that of ARIA. According to the key lengths of underlying encryption algorithm, ARIA-CTR PRFs are denoted by "ARIA_128_CTR_PRF", "ARIA_192_CTR_PRF" and "ARIA_256_CTR_PRF". The usage requirements of [RFC6188][I-D.ietf-avtcore-srtp-aes-gcm] regarding the AES-CM PRF apply to the ARIA-CTR PRF as well. The PRFs for ARIA crypto suites with SRTP are defined by ARIA-CTR PRF of the equal key length with the encryption algorithm (see Section 2). SRTP_ARIA_128_CTR_HMAC, SRTP_AEAD_ARIA_128_GCM, and SRTP_AEAD_ARIA_128_CCM MUST use the ARIA_128_CTR_PRF Key Derivation Function. SRTP_ARIA_192_CTR_HMAC MUST use that ARIA_192_CTR_PRF Key Derivation Function. And SRTP_ARIA_256_CTR_HMAC, SRTP_AEAD_ARIA_256_GCM, and SRTP_AEAD_ARIA_256_CCM MUST use the ARIA_256_CTR_PRF Key Derivation Function.

4. Security Considerations

At the time of writing this document no security problem has been found on ARIA (see [TSL]).

The security considerations in [RFC3610] [GCM] [RFC3711] [RFC5116] [RFC6188] [RFC6904] [I-D.ietf-avtcore-srtp-aes-gcm] apply to this document as well. Ciphersuites with short tag length may be considered for specific application environments stated in Section 7.5 of [RFC3711], but the risk of weak authentication described in Section 9.5.1 of [RFC3711] should be taken into account.

5. IANA Considerations

5.1. Security Descriptions (SDES)

SDP Security Descriptions [RFC4568] defines SRTP "crypto suites". In order to allow SDP to signal the use of the algorithms defined in this document, IANA is requested to add the below crypto suites to the "SRTP Crypto Suite Registrations" created by [RFC4568], at time of writing located on the following IANA page:
<http://www.iana.org/assignments/sdp-security-descriptions/>.

```

srtp-crypto-suite-ext = "ARIA_128_CTR_HMAC_SHA1_80" /

5.2. DTLS-SRTP

DTLS-SRTP [RFC5764] defines a DTLS-SRTP "SRTP Protection Profile". In order to allow the use of the algorithms defined in this document in DTLS-SRTP, IANA is requested to add the below protection profiles to the "DTLS-SRTP Protection Profiles" created by [RFC5764], at time of writing located on the following IANA page:
<http://www.iana.org/assignments/srtp-protection/> .

```

SRTP_ARIA_128_CTR_HMAC_SHA1_80 = {TBD,TBD}

SRTP_AEAD_ARIA_128_CCM_12 = {TBD,TBD}
SRTP_AEAD_ARIA_256_CCM_12 = {TBD,TBD}

```

5.3. MIKEY

[RFC3830] and [RFC5748] define encryption algorithms and PRFs for the SRTP policy in MIKEY. In order to allow the use of the algorithms defined in this document in MIKEY, IANA is requested to add the below three encryption algorithms to the "MIKEY Security Protocol Parameters SRTP Type 0 (Encryption algorithm)" and to add the below PRF to the "MIKEY Security Protocol Parameters SRTP Type 5 (Pseudo Random Function)" created by [RFC3830], at time of writing located on the following IANA page: <http://www.iana.org/assignments/mikey-payloads/>.

SRTP Enc. alg	Value
ARIA-CTR	TBD
ARIA-CCM	TBD
ARIA-GCM	TBD

Appendix A. SRTP Parameters for DTLS-SRTP and MIKEY

A.1. DTLS-SRTP

The following list indicates the SRTP transform parameters for each protection profile. The parameters `cipher_key_length`, `cipher_salt_length`, `auth_key_length`, and `auth_tag_length` express the number of bits in the values to which they refer. The `maximum_lifetime` parameter indicates the maximum number of packets that can be protected with each single set of keys when the parameter profile is in use. All of these parameters apply to both RTP and RTCP, unless the RTCP parameters are separately specified.

SRTP_ARIA_128_CTR_HMAC_SHA1_80

Note that SRTP Protection Profiles which use AEAD algorithms do not specify an auth_function, auth_key_length, or auth_tag_length, since they do not use a separate auth_function, auth_key, or auth_tag. The term aead_auth_tag_length is used to emphasize that this refers to the authentication tag provided by the AEAD algorithm and that this tag is not located in the authentication tag field provided by SRTP/SRTCP.

A.2. MIKEY

MIKEY specifies the algorithm family separately from the key length (which is specified by the Session Encryption key length) and the authentication tag length. The SDP Security Descriptions [RFC4568] crypto suits and corresponding DTLS-SRTP [RFC5764] protection profiles are mapped to MIKEY parameter sets as shown below.

	Encryption Algorithm	Encryption Key Length	Auth. Tag Length

The length of encrypted payload is larger than that of payload by 16 octets which the length of the tag from GCM. For other GCM ciphersuites with shorter tag length than 16 octets, test vectors can be obtained by truncation from ARIA-GCM test verctors.

B.4. Key Derivation Test Vector

This section provides test vectors for the default key derivation function, which uses ARIA in Counter Mode. In the following, we walk through the initial key derivation for the ARIA Counter Mode cipher, which requires a 16/24/32 octet session encryption key according to the session encryption key length and a 14 octet session salt, and an authentication function which requires a 94 octet session authentication key. These values are called the cipher key, the cipher salt, and the auth key in the following. The test vectors are generated in the same way with the test vectors of key derivation functions in [RFC3711] and [RFC6188] but with each invocation of AES replaced with an invocation of ARIA.

B.4.1. ARIA_128_CTR_PRF

The inputs to the key derivation function are the 16 octet master key and the 14 octet master salt:

```
