A YANG model for Multicast Protocol for Low power and lossy Networks
(MPL)
`draft-ietf-roll-mpl-yang-01`

Abstract

This document defines a YANG data model for management of Multicast Protocol for Low power and lossy Networks (MPL) implementations. The data model includes configuration data and state data.

Note

Discussion and suggestions for improvement are requested, and should be sent to `roll@ietf.org`.

Status of This Memo

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <https://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on October 1, 2018.

1. Introduction

This document defines a YANG [RFC6020] data model for management of Multicast Protocol for Low power and lossy Networks (MPL) [RFC7731] implementations. The data model covers configuration of MPL parameters per interface. It also provides information about which Multicast addresses are operationally used, and the seeds of the forwarded packets.

1.1. Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119].

The following terms are defined in [RFC6241] and are not redefined here:

- o client
- o configuration data
- o server

- o state data

The following terms are defined in [RFC6020] and are not redefined here:

- o data model
- o data node

The terminology for describing YANG data models is found in [RFC6020].

Terms like message, domain, seed, I, k, c are defined in [RFC7731].

Multiple copies of a message can be received or sent by a node.

1.1.1. Tree Diagrams

A simplified graphical representation of the data model is used in the YANG modules specified in this document. The meaning of the symbols in these diagrams is as follows:

Brackets "[" and "]" enclose list keys.

Abbreviations before data node names: "rw" means configuration data (read-write) and "ro" state data (read-only).

Symbols after data node names: "?" means an optional node, "!" means a presence container, and "*" denotes a list and leaf-list.

Parentheses enclose choice and case nodes, and case nodes are also marked with a colon ("::").

Ellipsis ("...") stands for contents of subtrees that are not shown.

2. MPL model

This document defines the YANG module "ietf-yang-mpl", which specifies a data model for MPL servers. The model is separated into four modules which can be loaded independently to accommodate the storage space to the wanted functionality. The model consists of the following parts: (1) a "mpl-domain" part that describes the MPL-domains and associated Multicast addresses and the interfaces on which the Multicast addresses are enabled, (2) a "mpl-op" part that describes the parameters settings per seed, (3) a "mpl-seeds" part that describes the MPL buffer contents and the Trickle timer values, and (4) a "mpl-statistics" part that describes the number of lost and

correctly forwarded messages. The data model, divided in four modules, has the following structure for MPL configuration per node:

```

module: ietf-yang-mpl-domain
  +-rw domain
    +-rw (single)?
      +-:(mpl-domain)
        |  +-rw mpl-domain
          |    +-rw domains* [domainID]
            |      +-rw domainID      uint16
            |      +-rw MClist*      inet:ipv6-address
            |    +-rw addresses* [MCaddress]
              +-rw MCaddress      inet:ipv6-address
              +-rw interfaces*   string
      +-:(mpl-single)
        +-rw mpl-single
        +-rw MCaddresses*   inet:ipv6-address

module: ietf-yang-mpl-ops
  +-rw mpl-ops
    +-rw SE_LIFETIME?           uint16
    +-rw PROACTIVE_FORWARDING? boolean
    +-rw SEED_SET_ENTRY_LIFETIME? uint64
    +-rw mpl-parameter* [domainID]

4. yang-mpl modules

This section describes four yang modules. The model is based on the MPL specification published in [RFC7731] and the specification of [RFC6206]. The identification of the interfaces follows the specification of ietf-interfaces of [RFC7223].

The data model allows to set values to the parameters of the MPL algorithm. This approach requires an active manager process to set the values without use of DHCP as described in: [RFC7774].

The names of the four modules are: yang-mpl-domain, yang-mpl-ops, yang-mpl-seeds, and yang-mpl-statistics, described in subsections with the same name.

4.1. yang-mpl-domain module

This module describes (1) the MPL domains and the associated multicast addresses, and (2) the interfaces and the multicast addresses for which they are enabled.

The model features a choice such that for constrained devices with only one "single" interface and only one "single" domain, the model specifies a list of MC addresses for which the single interface is enabled.

    }
} // container mpl-simple
} // choice simple
} // container module
} //module ietf-yang-mpl-domain

```

<CODE ENDS>

4.2. yang-mpl-ops module

This module models the operational aspects of MPL. Per domain MPL specifies four parameters I_MAX, I_MIN, K, and TIMER_EXPIRATIONS for data and control messages. The value of the MPL intervals are expressed in TUNIT. The entry SE_LIFETIME taken over from [RFC7774] fixes TUNIT to milliseconds. For very constrained devices with only one domain there can be only one instance of mpl-parameter list.

<CODE ENDS>

4.3. yang-mpl-seeds module

This module specifies the current values of the operation of the MPL forwarder. The values are acquired by the client and set by the server. The module specifies a set of message buffers, with a buffer per seed and domain. In constrained devices there will be only one domain, but probably multiple seeds.

The message buffer contains a set of messages where each message is uniquely identified by its sequence number and seed. The associated I, c, e, and t values indicate the progress of MPL with respect to this message, as specified in [RFC7731]. A forwarder sends and receives multiple copies of a message. When a forwarder has sent (received) a copy of a message, the forwarder has sent (received) that message.

For forwarders which are seeds, local has value true and seqno is the sequence number of the next message to send.

<CODE ENDS>

4.4. yang-mpl-statistics module

This module specifies the operation of the MPL forwarder expressed in number of messages and copies. The values are acquired by the client and set by the server. Statistics are specified per seed and domain. In constrained devices there will be only one domain, but probably multiple seeds.

The parameter k determines how many copies of a message can be forwarded. The counters c-too-high, nr-forwarded, and nr-not-forwarded give insight in the consequences of the current value of k.

The other counters give insight in the loss of messages caused by the medium or forwarding delays. The inconsistent/consistent counters indicate when consistent or inconsistent messages were received according to the definition of consistent in [RFC7731].

<CODE ENDS>

5. IANA Considerations

This specification has no consequences for IANA.

6. Acknowledgements

Andy Bierman has commented on the use of YANG for mpl. YANG doctors pointed out a wrong use of config.

7. Changelog

Changes from version 00 to version 01

- o config false in "statistics" and "seeds" modules
- o separated into 4 modules
- o inserted choice in domain modules
- o more explanatory text
- o renamed some parameters
- o Introduced section per module
- o reset of statistics is added
