OVAL(R) System Characteristics Model  
draft-rothenberg-sacm-oval-sys-char-model-01

**Abstract**

This document specifies Version 5.11.1 of the OVAL System Characteristics Model which provides a framework for representing low-level system configuration information that can be extended to support platform-specific constructs.

**Status of This Memo**

This Internet-Draft is submitted in full conformance with the provisions of BCP 78 and BCP 79.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF). Note that other groups may also distribute working documents as Internet-Drafts. The list of current Internet-Drafts is at <http://datatracker.ietf.org/drafts/current/>.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

This Internet-Draft will expire on March 11, 2017.

## 1. Introduction

The Open Vulnerability and Assessment Language (OVAL) [OVAL-WEBSITE] is an international, information security community effort to standardize how to assess and report upon the machine state of systems. For over ten years, OVAL has been developed in collaboration with any and all interested parties to promote open and publicly available security content and to standardize the representation of this information across the entire spectrum of security tools and services.

OVAL provides an established framework for making assertions about a system's state by standardizing the three main steps of the assessment process: representing the current machine state; analyzing the system for the presence of the specified machine state; and representing the results of the assessment which facilitates collaboration and information sharing among the information security community and interoperability among tools.

This draft is part of the OVAL contribution to the IETF SACM WG that standardizes the representation of the current machine state of a system. It is intended to serve as a starting point for the endpoint posture assessment data modeling needs of SACM specifically Posture Attributes.

### 1.1. Requirements Language

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in RFC 2119 [RFC2119].

## 2. OVAL System Characteristics Model

The OVAL System Characteristics Model is used to represent low-level, system settings that describe the current state of a system. The OVAL System Characteristics Model serves as a basis for extension to create platform-specific, low-level configuration information models.

Property	Type	Count	Description
generator	oval:GeneratorType	1	Information regarding the generation of the OVAL System Characteristics. The timestamp property of the

			generator MUST represent the time at which the system state information was collected.
system_info	SystemInfoType	0..*	Information used to identify the system under test.
collected_objects	CollectedObjectsType	0..1	Contains the mapping between OVAL Objects defined in the OVAL Definitions and the OVAL Items that were collected from the system under test.
system_data	SystemDataType	0..1	Contains the OVAL Items that were collected from the system under test.
signature	ext:Signature	0..1	Mechanism to ensure the integrity and authenticity of the OVAL System Characteristics content.

Table 1: oval\_system\_characteristics Construct

### 2.1. SystemInfoType

The SystemInfoType defines the basic identifying information associated with the system under test.

Cokus, et al.

Expires March 11, 2017

[Page 4]

Internet-Draft

OVAL System Characteristics Model

September 2016

Property	Type	Count	Description
os_name	string	0..1	The operating system running on the system under test.
os_version	string	1	The version of the operating system running on the system under test.
architecture	string	1	The hardware architecture type of the system under test.
primary_host_name	string	1	The primary host name of the system under test.
interfaces	any	0..*	The network interface(s) present on the system under test.
extension_point	any	0..*	An extension point that allows for the inclusion of any additional identifying information associated with the system under test.

Table 2: SystemInfoType Construct

## 2.2. InterfacesType

The `InterfacesType` provides a container for zero or more interfaces.

Property	Type	Count	Description
<code>interface</code>	<code>InterfaceType</code>	<code>0..*</code>	One or more interfaces.

Table 3: `InterfacesType` Construct

## 2.3. InterfaceType

The `InterfaceType` defines the information associated with a network interface on the system under test. This information may help to identify a specific system on a network.

Cokus, et al.  
Internet-Draft

Expires March 11, 2017

[Page 5]

OVAL System Characteristics Model

September 2016

Property	Type	Count	Description
<code>interface_name</code>	<code>string</code>	1	The name of the interface.
<code>ip_address</code>	<code>string</code>	1	The Internet Protocol (IP) address of the interface.
<code>mac_address</code>	<code>string</code>	1	The Media Access Control (MAC) address of the interface. MAC addresses MUST be formatted according to IEEE 802-2001 Section 9.2.1 [IEEE-STD-802-2001].

Table 4: `InterfaceType` Construct

## 2.4. CollectedObjectType

The `CollectedObjectType` is a container for one or more objects of type `ObjectType` that were used for data collection on the system under test.

## 2.5. ObjectType

The `ObjectType` provides a mapping between an OVAL Object, defined in content based on the OVAL Definitions Model, and the OVAL Items collected on the system under test.

Property	Type	Count	Description
<code>id</code>	<code>oval:ObjectIDPattern</code>	1	The globally unique identifier of an OVAL Object.
<code>version</code>	<code>unsigned integer</code>	1	The version of the globally unique OVAL Object.
<code>variable_instance</code>	<code>unsigned integer</code>	<code>0..1</code>	The unique identifier that differentiates

Cokus, et al.  
Internet-Draft

Expires March 11, 2017

[Page 6]

OVAL System Characteristics Model

September 2016

between each unique instance of an OVAL Object.

			If an OVAL Object utilizes an OVAL variable, a unique instance of each OVAL object must be created for each OVAL Variable value. Default Value: '1'
comment	string	0..1	The documentation associated with the OVAL Object referenced by the id property.
flag	oval:FlagEnumeration	1	The outcome associated with OVAL Item collection.
message	oval:MessageType	0..*	Any messages that are relayed from a tool at run-time.
variable_value	VariableValueType	0..*	The value(s) associated with the variable(s) used by the OVAL object referenced by the id property.

reference	ReferenceType	0..*	The identifiers of OVAL Items collected by the OVAL object referenced by the id property.
-----------	---------------	------	---

Table 5: ObjectType Construct

## 2.6. VariableValueType

The VariableValueType identifies an OVAL Variable and value that is used by an OVAL Object during OVAL Item collection.

Property	Type	Count	Description
variable_id	oval:variableIDPattern	1	The unique identifier of an OVAL Variable.
value	string	1	A value associated with the OVAL Variable identified by the variable_id property.

Table 6: VariableValueType Construct

## 2.7. ReferenceType

The ReferenceType identifies an OVAL Item that was collected during OVAL Item collection.

Property	Type	Count	Description
item_ref	oval:ItemIDPattern	1	The unique identifier of an OVAL Item.

Table 7: ReferenceType Construct

Cokus, et al.  
Internet-Draft

Expires March 11, 2017

[Page 8]

OVAL System Characteristics Model September 2016

## 2.8. SystemDataType

The SystemDataType provides a container for all of the OVAL Items that were collected on the system under test.

## 2.9. ItemType

The ItemType is the abstract OVAL Item that defines the common properties associated with all OVAL Items defined in the OVAL System Characteristics OVAL Component Models.

Property	Type	Count	Description
id	oval:ItemIDPattern	1	The unique identifier of an OVAL Item. The id property is unique within a given instantiation of the OVAL System Characteristics Model.
status	StatusEnumeration	0..1	The status property of an OVAL Item conveys the outcome of the system data collection effort; Default Value: 'exists'
message	MessageType	0..50	Any messages that are relayed from a tool at run-time during the collection of an OVAL Item.

Table 8: GeneratorType ItemType

## 2.10. EntityAttributeGroup

The EntityAttributeGroup defines the properties that are common to all OVAL Item Entities in the OVAL Language.

Cokus, et al.  
Internet-Draft

Expires March 11, 2017

[Page 9]

OVAL System Characteristics Model September 2016

Property	Type	Count	Description
datatype	oval:DatatypeEnumeration	0..1	The datatype for the entity. Default value: 'string'
mask	boolean	0..1	Tells the data

			collection that this entity contains sensitive data. Data marked with mask='true' should be used only in the evaluation, and not be included in the results. Note that when the mask property is set to 'true', all child field elements must be masked regardless of the child field's mask attribute value. Default value: 'false'
status	StatusEnumeration	0..1	The status of the collection for an OVAL Item Entity. Default value: 'exists'

Table 9: EntityAttributeGroup Construct

#### 2.11. FlagEnumeration

The FlagEnumeration defines the acceptable outcomes associated with the collection of OVAL Items for a specified OVAL Object.

Cokus, et al.

Expires March 11, 2017

[Page 10]

Internet-Draft

OVAL System Characteristics Model

September 2016

value	Description
error	This value indicates that an error prevented the determination of the existence of OVAL Items on the system.
complete	This value indicates that every matching OVAL Item on the system has been identified and represented in the OVAL System Characteristics. It can be assumed that no additional matching OVAL Items exist on the system.
incomplete	This value indicates that matching OVAL Items exist on the system, however, only a subset of those matching OVAL Items have been identified and represented in the OVAL System Characteristics. It cannot be assumed that no additional matching OVAL Items exist on the system.
does not exist	This value indicates that no matching OVAL Items were found on the system.
not collected	This value indicates that no attempt was made to collect OVAL Items on the system.
not applicable	This value indicates that the specified OVAL Object is not applicable to the system under test.

Table 10: FlagEnumeration Construct

#### 2.12. StatusEnumeration

The StatusEnumeration defines the acceptable status values associated with the collection of an OVAL Item or the properties of an OVAL Item.

value	Description
error	This value indicates that there was an error collecting an OVAL Item or a property of an OVAL Item.
exists	This value indicates that an OVAL Item, or a property of an OVAL Item, exists on the system and was collected.
does not exist	This value indicates that an OVAL Item, or a property of an OVAL Item, does not exist on the system.
not collected	This value indicates that no attempt was made to collect an OVAL Item or a property of an OVAL Item.

Table 11: StatusEnumeration Construct

#### 2.13. EntityItemSimpleBaseType

The EntityItemSimpleBaseType is an abstract type that defines a base type for all simple OVAL Item Entities.

Property	Type	Count	Description
attributes	EntityAttributeGroup	1	The standard attributes available to all entities.
value	string	0..1	The value of the entity. An empty string value SHOULD be used when a status other than 'exists' is specified.

Table 12: EntityItemSimpleBaseType Construct

#### 2.14. EntityItemComplexBaseType

The EntityItemComplexBaseType is an abstract type that defines a base type for all complex OVAL Item Entities.

Property	Type	Count	Description
attributes	EntityAttributeGroup	1	The standard attributes available to all entities.

Table 13: EntityItemComplexBaseType Construct

#### 2.15. EntityItemIPAddressType

The EntityItemIPAddressType extends the EntityItemSimpleBaseType and describes an IPv4 or IPv6 IP address or prefix.

Property	Type	Count	Description
datatype	oval:SimpleDatatype Enumeration	1	Possible values: <ul style="list-style-type: none"> <li>o 'ipv4_address'</li> <li>o 'ipv6_address'</li> </ul> Also allows an empty string value.

Figure 1: EntityItemIPAddressType Construct

#### 2.16. EntityItemIPAddressStringType

The EntityItemIPAddressStringType extends the EntityItemSimpleBaseType and describes an IPv4 or IPv6 IP address or prefix or a string representation of the address.

Cokus, et al. Expires March 11, 2017 [Page 13]  
 Internet-Draft OVAL System Characteristics Model September 2016

Property	Type	Count	Description
datatype	oval:SimpleDatatype Enumeration	1	Possible values: <ul style="list-style-type: none"> <li>o 'ipv4_address'</li> <li>o 'ipv6_address'</li> <li>o 'string'</li> </ul> Also allows an empty string value.

Figure 2: EntityItemIPAddressStringType Construct

#### 2.17. EntityItemAnySimpleType

The EntityItemAnySimpleType extends the EntityItemSimpleBaseType and describes any simple data.

Property	Type	Count	Description
datatype	oval:SimpleDatatypeEnumeration	1	Any simple datatype. Also allows an empty string value.

Table 14: EntityItemAnySimpleType Construct

#### 2.18. EntityItemBinaryType

The EntityItemBinaryType extends the EntityItemSimpleBaseType and describes any simple binary data.

Property	Type	Count	Description
datatype	oval:SimpleDatatypeEnumeration	1	This value is fixed as 'binary'. Also allows an empty string value.

Table 15: EntityItemBinaryType Construct

#### 2.19. EntityItemBoolType

The EntityItemBoolType extends the EntityItemSimpleBaseType and describes any simple boolean data.

Property	Type	Count	Description
datatype	oval:SimpleDatatypeEnumeration	1	This value is fixed as 'boolean'. Also allows an empty string value.

Table 16: EntityItemBoolType Construct

#### 2.20. EntityItemFloatType

The EntityItemFloatType extends the EntityItemSimpleBaseType and describes any simple float data.

Property	Type	Count	Description
datatype	oval:SimpleDatatypeEnumeration	1	This value is fixed as 'float'. Also allows an empty string value.

Table 17: EntityItemFloatType Construct

#### 2.21. EntityItemIntType

The EntityItemIntType extends the EntityItemSimpleBaseType and describes any simple integer data.

Property	Type	Count	Description
datatype	oval:SimpleDatatypeEnumeration	1	This value is fixed as 'int'. Also allows an empty string value.

Table 18: EntityItemIntType Construct

#### 2.22. EntityItemStringType

The EntityItemStringType extends the EntityItemSimpleBaseType and describes any simple string data.

Property	Type	Count	Description
datatype	oval:SimpleDatatypeEnumeration	0..1	This value is fixed as 'string'.

Table 19: EntityItemStringType Construct

#### 2.23. EntityItemRecordType

The EntityItemRecordType extends the EntityItemComplexBaseType and allows assertions to be made on entities with uniquely named fields. It is intended to be used to assess the results of things such as SQL statements and similar data.

Cokus, et al.

Expires March 11, 2017

Internet-Draft

OVAL System Characteristics Model

September 2016

Property	Type	Count	Description
datatype	oval:ComplexDatatypeEnumeration	0..1	This value is fixed as 'record'.
field	EntityItemFieldType	0..*	Defines the name of the field whose value will be assessed.

Table 20: EntityItemRecordType Construct

#### 2.24. EntityItemFieldType

The EntityItemFieldType defines an entity type that captures the details of a single field for a record.

Property	Type	Count	Description
attributes	EntityAttributeGroup	1	The standard attributes available to all entities.
name	string	1	The name of the field. Names MUST be all lower case characters in the range of a-z.
value	string	0..1	The value of the field. An empty string value SHOULD be used when a status other than 'exists' is specified.

Table 21: EntityItemFieldType Construct

## 2.25. EntityItemVersionType

The EntityItemVersionType extends the EntityItemSimpleBaseType and describes a version string data.

Property	Type	Count	Description
datatype	oval:SimpleDatatypeEnumeration	1	This value is fixed as 'version'. Also allows an empty string value.

Table 22: EntityItemVersionType Construct

## 2.26. EntityItemFileSetRevisionType

The EntityItemFileSetRevisionType extends the EntityItemSimpleBaseType and describes a file set revision string data.

Property	Type	Count	Description
datatype	oval:SimpleDatatypeEnumeration	1	This value is fixed as 'fileset_revision'. Also allows an empty string value.

Table 23: EntityItemFileSetRevisionType Construct

## 2.27. EntityItemIOSVersionType

The EntityItemIOSVersionType extends the EntityItemSimpleBaseType and describes a Cisco IOS version string data.

Property	Type	Count	Description
datatype	oval:SimpleDatatypeEnumeration	1	Possible values: o 'ios_version' o 'string'  The string type is an option in order to allow use of regular expressions.

Figure 3: EntityItemIOSVersionType Construct

## 2.28. EntityItemEVRStringType

The EntityItemEVRStringType extends the EntityItemSimpleBaseType and describes an EPOCH:VERSION-RELEASE string data.

Property	Type	Count	Description
datatype	oval:SimpleDatatypeEnumeration	1	This value is fixed as 'evr_string'. Also allows an empty string value.

Table 24: EntityItemEVRStringType Construct

## 2.29. EntityItemDebianEVRStringType

The EntityItemDebianEVRStringType extends the EntityItemSimpleBaseType and describes an EPOCH:UPSTREAM\_VERSION-DEBIAN\_REVISION string data for a Debian package.

   Internet-Draft     OVAL System Characteristics Model     September 2016

```

        looked for but not found on the
        system. If no object element is
        written in this case, users of the
        system characteristics file will
        not know whether the object was
        not found or no attempt was made

```

```

        to collect it.</xsd:documentation>
<xsd:documentation>The required id
attribute is the id of the global
OVAL Object.</xsd:documentation>
<xsd:documentation>The required
version attribute is the specific
version of the global OVAL Object
that was used by the data
collection engine. The version is
necessary so that analysis using a
system characteristics file knows
exactly what was
collected.</xsd:documentation>
<xsd:documentation>The optional
variable_instance identifier is a
unique id that differentiates each
unique instance of an object.
Capabilities that use OVAL may
reference the same definition
multiple times and provide
different variable values each
time the definition is referenced.
This will result in multiple
instances of an object being
included in the OVAL System
Characteristics file (definitions
that do not use variables can only
have one unique instance). The
inclusion of this unique instance
identifier allows the OVAL Results
document to associate the correct
objects and items for each
combination of supplied
values.</xsd:documentation>
<xsd:documentation>The optional
comment attribute provides a short
description of the
object.</xsd:documentation>
<xsd:documentation>The required flag
attribute holds information
regarding the outcome of the data
collection. For example, if there

OVAL System Characteristics Model

September 2016

collection. For example, if an item exists on the system then the status would reflect this with a value of 'exists'. If there was an error collecting any information about an item that is known to exist, then the status would be 'error'. An error specific to a particular entity should be addressed at the entity level and not the item level. When creating items, any entities that can successfully be collected should be reported.</xsd:documentation>  
<xsd:documentation>In some cases, when an item for a specified object does not exist, it may be beneficial to report a partial match of an item showing what entities did exist and what entities did not exist for debugging purposes. This is especially true when considering items that are collected by objects with hierarchical object entities. An example of such a case is when a file\_object has a path entity equal to 'C:\' and a filename entity equal to 'test.txt' where 'test.txt' does not exist in the 'C:\' directory. This would result in the creation of a partially matching file\_item with a status of 'does not exist' where the path entity equals 'C:\' and the filename entity equals 'test.txt' with a status of 'does not exist'. By showing the partial match, someone reading a system-characteristics document can quickly see that a matching file\_item did not exist because the specified filename did not exist and not that the specified path did not exist. Again, please note that the implementation of partial matches, when an item for a specified object does not exist,

      a table that outlines how each

```

FlagEnumeration value effects evaluation of a given test. Note that this is related to the existence of a unique set of items identified by an object and not each item's compliance with a state. The left column identifies the FlagEnumeration value in question. The right column specifies the ResultEnumeration value that should be used when evaluating the collected object.</evaluation\_documentation>

flag value	test result is
error	error (test result depends on check_existence and check_attributes)
complete	unknown
incomplete	not applicable
does not exist	
not collected	
not applicable	

</evaluation\_chart>

</xsd:appinfo>

</xsd:annotation>

<xsd:restriction base="xsd:string">

  <xsd:enumeration value="error">

    <xsd:annotation>

      <xsd:documentation>A flag of 'error' indicates that there was an error trying to identify items on the system that match the specified object declaration. This flag is not meant to be used when there was an error retrieving a specific entity, but rather when it

could not be determined if an item exists or not. Any error in retrieving a specific entity should be

Cokus, et al. Expires March 11, 2017 [Page 37]  
Internet-Draft OVAL System Characteristics Model September 2016

```
represented by setting the
status of that specific
entity to
'error'.</xsd:documentation>
</xsd:annotation>
</xsd:enumeration>
<xsd:enumeration value="complete">
  <xsd:annotation>
    <xsd:documentation>A flag of
      'complete' indicates that
      every matching item on the
      system has been identified
      and is represented in the
      system characteristics
      file. It can be assumed
      that no additional
      matching items exist on
      the
      system.</xsd:documentation>
  </xsd:annotation>
</xsd:enumeration>
<xsd:enumeration value="incomplete">
  <xsd:annotation>
    <xsd:documentation>A flag of
      'incomplete' indicates
      that a matching item
      exists on the system, but
      only some of the matching
      items have been identified
      and are represented in the
      system characteristics
      file. It is unknown if
      additional matching items
      also exist. Note that with
      a flag of 'incomplete',
      each item that has been
      identified matches the
      object declaration, but
      additional items might
      also exist on the
      system.</xsd:documentation>
  </xsd:annotation>
</xsd:enumeration>
<xsd:enumeration
  value="does not exist">
  <xsd:annotation>
    <xsd:documentation>A flag of
      'does not exist' indicates
```

Cokus, et al. Expires March 11, 2017 [Page 38]  
Internet-Draft OVAL System Characteristics Model September 2016

```
that the underlying
structure is installed on
the system but no matching
item was found. For
example, the Windows
metabase is installed but
there were no items that
matched the
metabase_object. In this
example, if the metabase
itself was not installed,
then the flag would have
been 'not
applicable'.</xsd:documentation>
</xsd:annotation>
</xsd:enumeration>
<xsd:enumeration value="not collected">
  <xsd:annotation>
```

```

<xsd:documentation>A flag of
'not collected' indicates
that no attempt was made
to collect items on the
system. An object with
this flag will produce an
'unknown' result during
analysis since it is
unknown if matching items
exists on the system or
not. This is different
from an 'error' flag
because an 'error' flag
indicates that an attempt
was made to collect items
on system whereas a 'not
collected' flag indicates
that an attempt was not
made to collect items on
the
system.</xsd:documentation>
</xsd:annotation>
</xsd:enumeration>
<xsd:enumeration
  value="not applicable">
  <xsd:annotation>
    <xsd:documentation>A flag of
      'not applicable' indicates
      that the specified object
      is not applicable to the

```

```

    system being
    characterized. This could
    be because the data
    repository is not
    installed or that the
    object structure is for a
    different flavor of
    systems. An example would
    be trying to collect
    objects related to a Red
    Hat system off of a
    windows system. Another
    example would be trying to
    collect an rpminfo_object
    on a Linux system if the
    rpm packaging system is
    not installed. If the rpm
    packaging system is
    installed and the
    specified rpminfo_object
    could not be found, then
    the flag would be 'does
    not
    exist'.</xsd:documentation>

        <xsd:documentation>The
            EntityItemRecordType defines an
            entity that consists of a number
            of named fields. This structure is
            used for representing a record
            from a database query and other
            similar structures where multiple
            related fields must be collected
            at once. Note that for all
            entities of this type, the only
            allowed datatype is
            'record'.</xsd:documentation>
        <xsd:documentation>Note the datatype
            attribute must be set to
            'record'.</xsd:documentation>
    <!--
    NOTE: The restriction that the only allowed
    datatype is 'record' is enforced by schema rules
    placed on each entity that uses this type.
    This is due to the fact that this type is developed
    as an xsd:extension of the oval-sc:EntityItemFieldType.
    This base type declares a datatype attribute. To restrict
    the datatype attribute to only allow 'record' would
    need an xsd:restriction. We cannot do both and
    xsd:extension and an xsd:restriction at the same time.
    -->
        <xsd:documentation>Note that when the
            mask attribute is set to 'true',
            all child field elements must be
            masked regardless of the child
            field's mask attribute

September 2016

```

        is extended by the entities of an
        individual item. This type
        provides uniformity to each entity
        by including the attributes found
        in the EntityItemSimpleBaseType.
        This type represents the epoch,
        upstream_version, and
        debian_revision fields, for a
        Debian package, as a single
        version string. It has the form
        "EPOCH:UPSTREAM_VERSION-DEBIAN_REVISION".
        Note that a null epoch (or
        '(none)' as returned by dpkg) is
        equivalent to '0' and would hence
        have the form
        0:UPSTREAM_VERSION-DEBIAN_REVISION.
        Comparisons involving this
        datatype should follow the
        algorithm outlined in Chapter 5 of
        the "Debian Policy Manual"
        (https://www.debian.org/doc/debian-policy/ch-controlfields.html#s-f-version).
        An implementation of this is the
        cmpversions() function in dpkg's
        enquiry.c.</xsd:documentation>
    </xsd:annotation>
    <xsd:simpleContent>
        <xsd:restriction

DHS, on behalf of the United States, owns the registered OVAL trademarks, identifying the OVAL STANDARDS SUITE and any component part, as that suite has been provided to the IETF Trust. A "(R)" will be used in conjunction with the first use of any OVAL trademark in any document or publication in recognition of DHS's trademark ownership.

#### 5. Acknowledgements

The authors wish to thank DHS for sponsoring the OVAL effort over the years which has made this work possible. The authors also wish to thank the original authors of this document Jonathan Baker, Matthew Hansbury, and Daniel Haynes of the MITRE Corporation as well as the OVAL Community for its assistance in contributing and reviewing the original document. The authors would also like to acknowledge Dave Waltermire of NIST for his contribution to the development of the original document.

#### 6. IANA Considerations

This memo includes no request to IANA.

#### 7. Security Considerations

While OVAL is just a set of data models and does not directly introduce security concerns, it does provide a mechanism by which to represent endpoint posture assessment information. This information could be extremely valuable to an attacker allowing them to learn about very sensitive information including, but not limited to: security policies, systems on the network, criticality of systems, software and hardware inventory, patch levels, user accounts and much more. To address this concern, all endpoint posture assessment information should be protected while in transit and at rest. Furthermore, it should only be shared with parties that are authorized to receive it.

Another possible security concern is due to the fact that content expressed as OVAL has the ability to impact how a security tool operates. For example, content may instruct a tool to collect certain information off a system or may be used to drive follow-up actions like remediation. As a result, it is important for security tools to ensure that they are obtaining OVAL content from a trusted source, that it has not been modified in transit, and that proper

Cokus, et al. Expires March 11, 2017 [Page 58]  
Internet-Draft OVAL System Characteristics Model September 2016

validation is performed in order to ensure it does not contain malicious data.
