

Bulk Transport Capacity

Bulk Transport Capacity

- BTC one of the driving forces behind IPPM, yet still no metric
- BTC Framework along with metrics proposed
- Treno metric not updated (now expired) (last 20% hard)

Current work

- Mark Allman has produced a program ('cap') for TCP studies that could be used as a metric
 - He wants to show that BTC metrics relate to actual implementations
 - Mark's plan: by end of summer have a draft, and a study relating cap to FreeBSD; he has resources allocated
-

So...

- If it has been desired for a long time, yet no metric...
 - Does “industry” need such a metric?
 - Is it ready to be standardized?
 - Is there anyone with an alternative they would advocate?
