

Preconfigured Kbm between Mobile and CN

- “Preconfigured Binding Management Keys for Mobile IPv6”
- draft-perkins-mobileip-precfg-kbm-00.txt
- A mobile node and a correspondent node may preconfigure a Binding Management Key for authorizing Binding Updates.
- For use when the mobile node and the correspondent node are able to configure such a key, and when the correspondent node has reason to trust mobile node will not violate trust
- Binding Update sequence number amply protects against replay
- Geared towards use of the Binding Authentication Data option
- Practically all implementations already support this anyway
