

# M and O Flags of IPv6 RA

(63<sup>rd</sup> IETF, IPv6 WG)

SooHong Daniel Park  
[soohong.park@samsung.com](mailto:soohong.park@samsung.com)

# Background & History

- December 1998
  - RFC2461 defined M and O flags
    - Just said **\*administered (stateful) protocol\***
  - RFC2462 described the use of these flags
    - M flag for both address information and other information
    - O flag for information excluding address
    - DHCPv6 was the subject of future work
    - Router Advertisements include flags specifying which mechanisms a host **should** use.
- July 2003
  - RFC3315 was published
- February 2004
  - RFC2462bis was published
    - 01 used **\*can\*** instead of **should** and **RFC3736** was included
    - 06 used **\*can be used to indicate which mechanisms are available.\***
    - 07 **removed M/O flags**
- April 2004
  - RFC3736 was published
- June 2004
  - RFC2461bis was published
    - DHCPv6 instead of administered (stateful) protocol
- July 2004
  - M/O flag as an individual submission
- November 2004
  - Adding **\*ietf\***
- April 2005
  - IPv6 WGLC as a Proposed Standard

- **draft-ietf-ipv6-ra-mo-flaga-01**
- **Defining HCB and ICB**
  - HCB (Host Configuration Behavior) is for RFC3315
  - ICB (Information Configuration Behavior) is for RFC3736
- **Defining new host variables**
  - M-Flag and O-Flag
- **Introducing DHCPv6 policy variables**
  - M-Policy and O-Policy
  - Default policy
- **Several clarifications on these flags**

# Meta-thread and approach

SAMSUNG DIGITall  
everyone's invited™

- **What we need to do...**
  - Clarifying ambiguous M/O flags
  - Elaborating 3315/3736 operations triggered by M/O flags and avoiding complex combination
  - Addressing requirements along with M/O flags
    - Then, documenting to match with them

# Requirement for DHCPv6 along with M/O flag

- **Req1: Avoiding complexity and timeout delay**
  - Ability for a host to get all desired and available DHCP configuration with a single DHCP message exchange
  - Ability for a host to admit M/O flags as a strong trigger
- **Req2: Considering limited resources**
  - Ability for a host not to send DHCP messages
  - Ability for a host to invoke ICB (excluding address)
  - Ability to do HCB and/or ICB with a limited counter
- **Req3: Invoking DHCP regardless of RA**
  - Ability for a host to invoke HCB and/or ICB by itself
- **Req4: Avoiding rogue behavior triggered by RA**
  - Ability for a host not to send DHCP messages
  - Ability to do HCB and/or ICB with a limited counter
- **Others...**

- **Addressing shape requirements first**
  - Then, move M/O flags document on
- **Separating DHC issues/requirements from the requirements and remaining them to be resolved by DHC WG**

# Moving forward...
