draft-ietf-geopriv-relative-loc

Brian Rosen

Current rev hasn't changed much

- Reissue of draft-tompson-relative-location-01

- Extends a PIDF-LO to have an offset represented by a geoshape

- Also defines a "map" element for a floorplan, database or other secondary reference data to enable display of "you are here" or "go there", etc.

- Defines TLV representations for the offset shapes

Open Issue

- If you don't understand <relative-offset> you take the reference as the location

- Some authors think this is wrong and if you don't understand the extension, you should get no location

- If the offset can be very large, this could be a problem

- Not a lot of email discussion on this point

To Do

- Some work on examples is needed

- Do we need to define a complete binary representation, or just the incremental that we have now?

- An edit pass

- Anything else?
