"X-"

(draft-saintandre-xdash-02)

Peter Saint-André
APPSAWG WG
IETF 81, Québec City

Segregating parameters into
standard ("Foo") and
non-standard ("X-Foo")
is a good idea whose time has passed

2

Recommendations

- Never prefix parameters with "X-"

- Provide unlimited parameter registries

- Mandate registration of all non-private parameters

- For public parameters, choose human-friendly but currently unused mnemonics

- For private or truly speculative parameters, use URI, VND, UUID, hash, etc.

- Never specify special handling for "X-" parameters
