IPsec SA setup
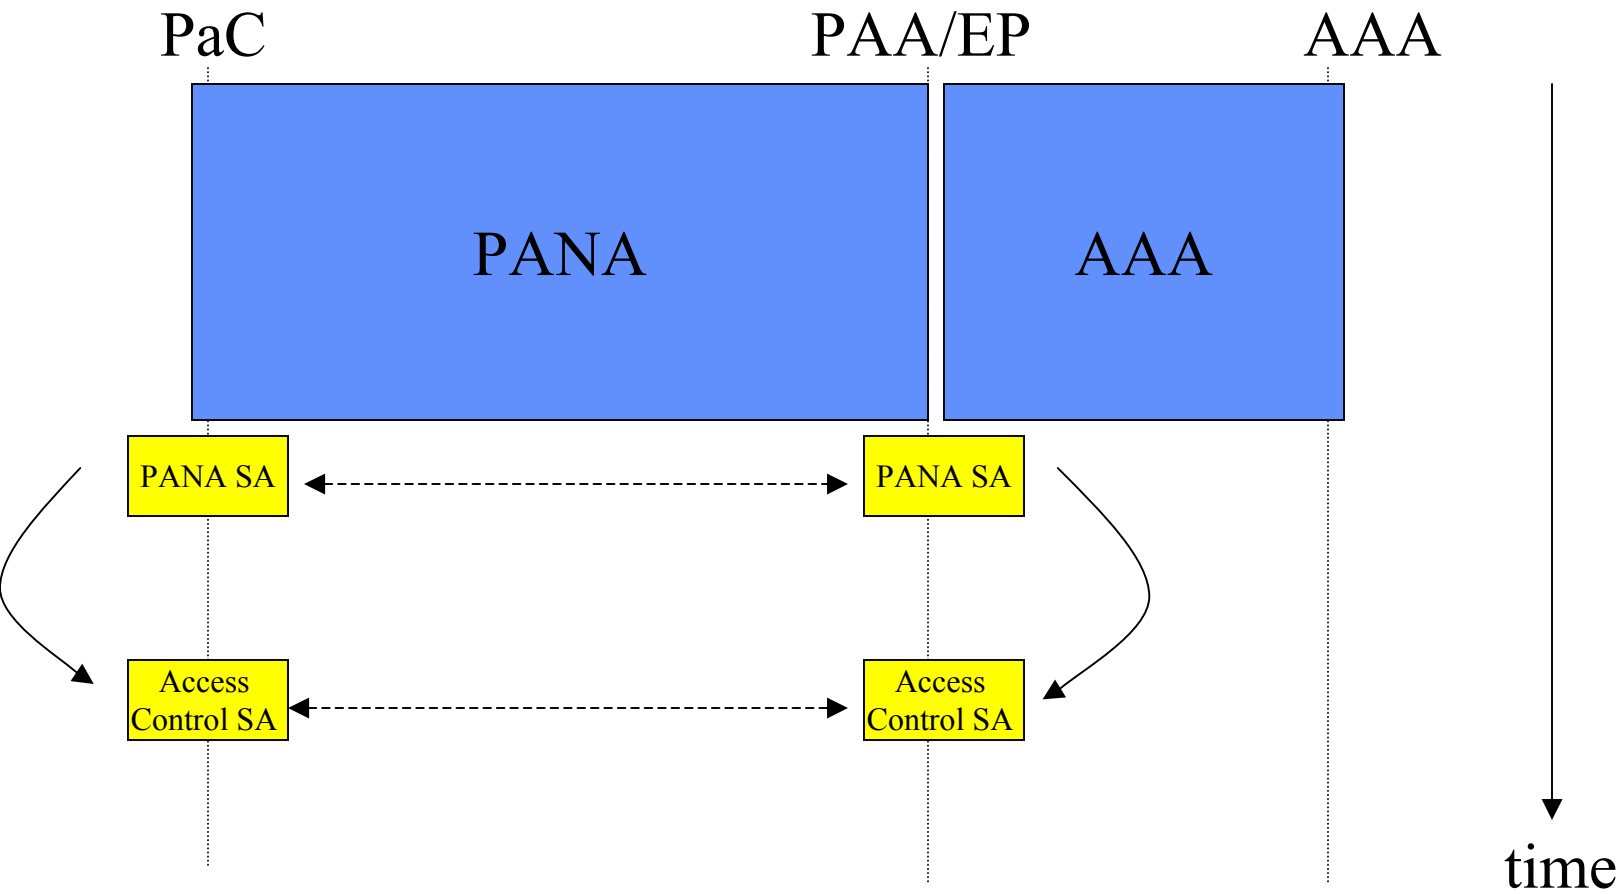

- At the succesful completion of a PANA exchange a PANA SA is setup
- This SA is used for re-auth and for subsequent PANA message security
- It does not provide security for user data

- Proposal:
  - Bootstrap an IPsec SA between the client and the AR using the PANA SA
  - This is NOT part of the PANA protocol itself

- Question:
  - Should the WG specify how the IPsec SA can be setup based on the PANA SA?
  - Not inventing anything new here
  - Possibly an informational RFC
