Introduction

- Accepted as WG document after IETF 67.
- Almost ready for publication...
- In WG last call
- Just one *wafer thin mint* left...

Comments since last call

- Acct-Session-Id and Acct-Multi-Session-Id are Text not String.
- Removed text about Disconnect-Request, that will go into 3576bis
- Added reference to [PREFIX] in RFC editor queue
- Duplicate detection and orderly delivery
 - Mandated duplicate detection.
 - Major change in the standard!

Comments since last call

- Duplicate detection (continued)
 - All well-known implementations do this already
- Noted that there is a per-session EAP identifier space when sessions are tracked via the State attribute
 - All well-known implementations do this already
 - Some, however, do not: document good practices.

Are we done yet?

- -02 will be submitted post IETF
 - Preliminary draft at <http://deployingradius.com/ietf/>
- There will likely be more issues found in the future..
- It's probably time to issue the document
