

NAT64 for PMIP and DSMIPv6 **IETF 78**

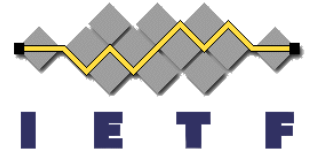

Behcet Sarikaya
Frank Xia
July 2010

Problem Statement

- IPv6-only mobile node NAT64 Pref A for IPv4-only server in domain A
- MN moves to domain B where NAT64 Pref B for the same IPv4-only server, MN continues to use the same synthetic IPv6 address so the packet will not get translated
- MN initiates RO, sends HoTI NAT64 drops
- No multicast support
- NAT keep-alives drain MN battery

Solution

- MN mobility is handled by DSMIPv6 or PMIPv6
- DNS64 no change
- Integrate NAT64 operation with binding cache at the HA or LMA
- Handover operations

SOLUTION

- Multicast support

Next Steps

- Is there interest in WG?

Thank you
