Communication innovation  
is landlocked by the PSTN

# Why not the obvious solution

- Phones numbers are allocated using a hierarchal delegation model. Build a global database aligned with these allocations.
- IETF designed such a system in the form of Public ENUM
- RFC 2916 done since 2000

One possible way to skin this cat

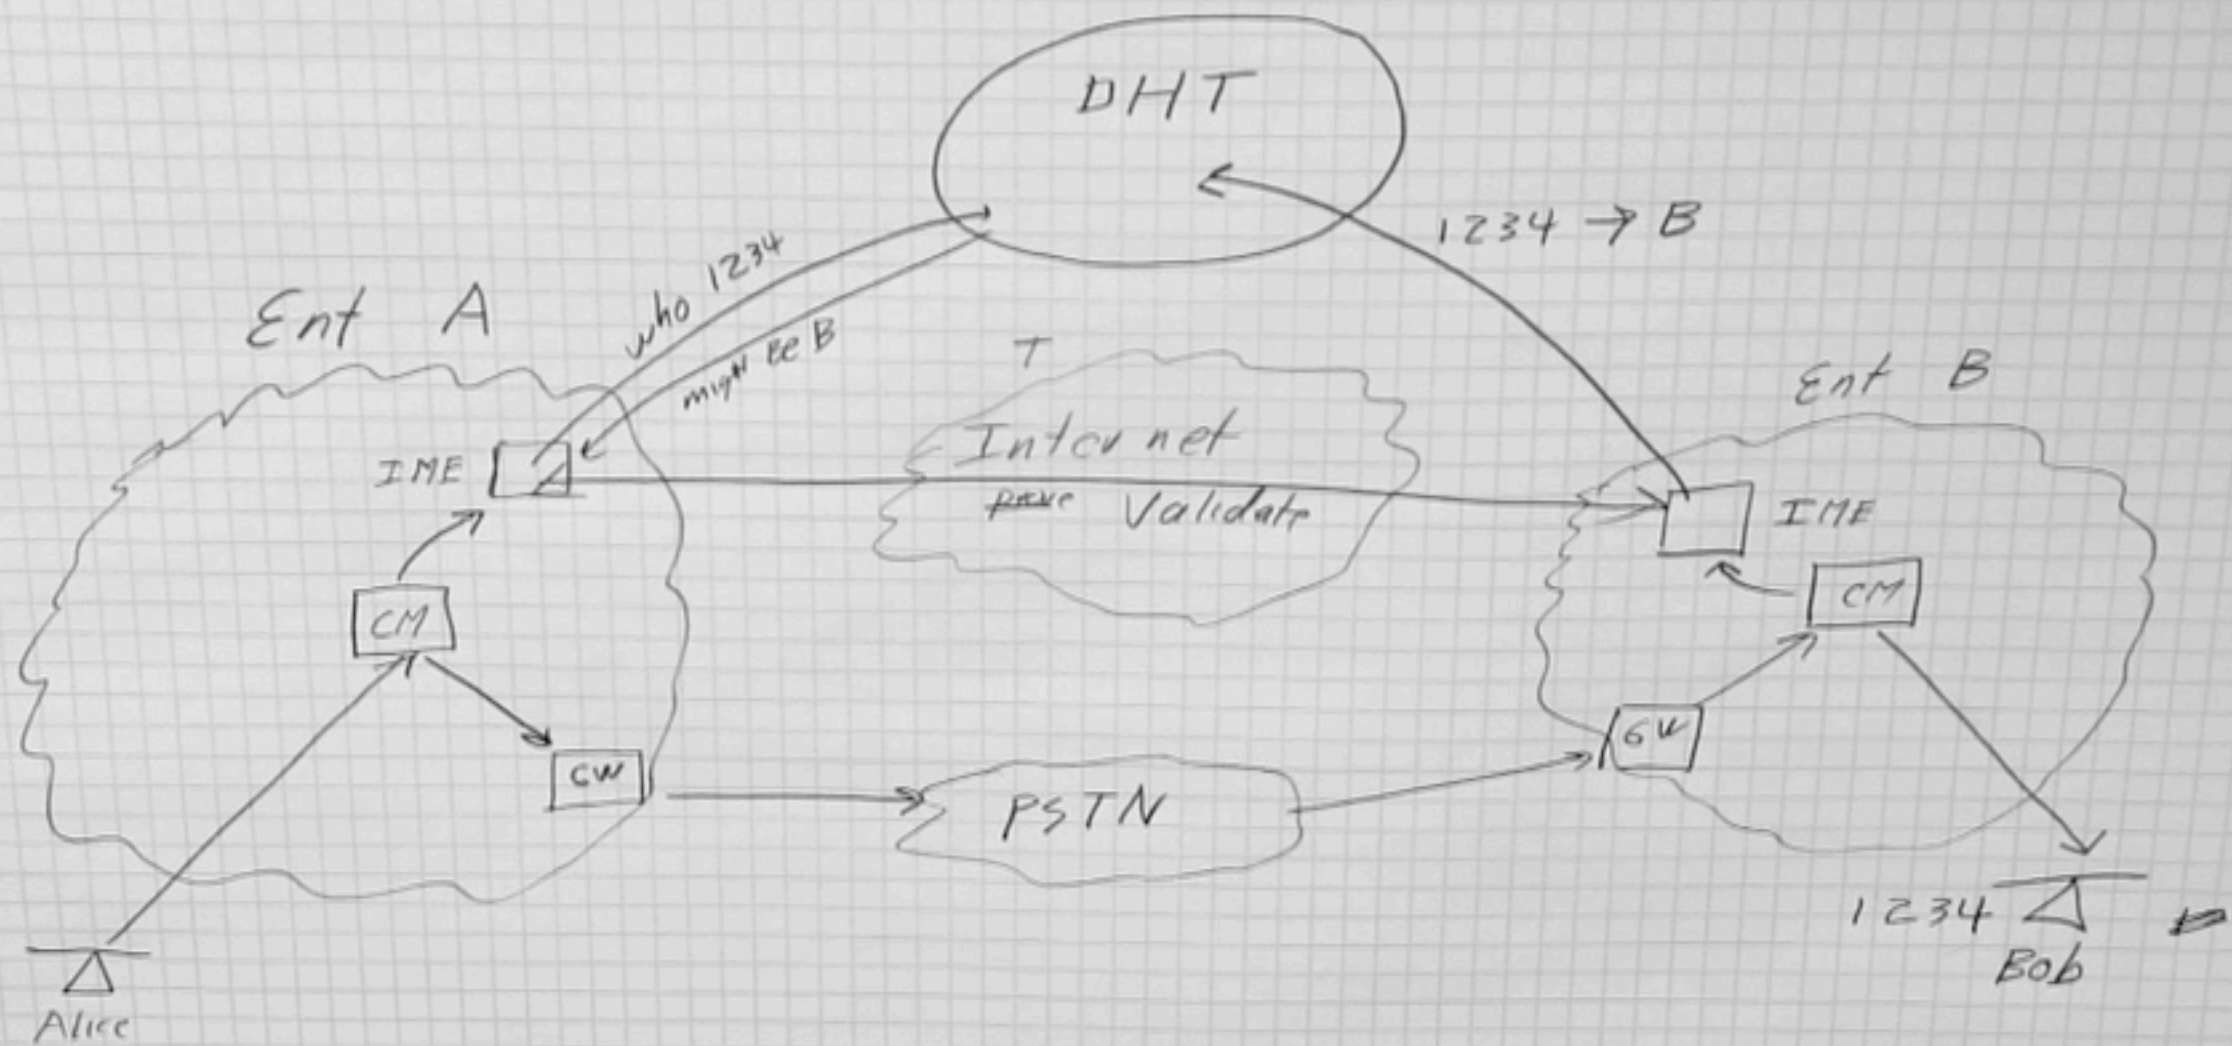

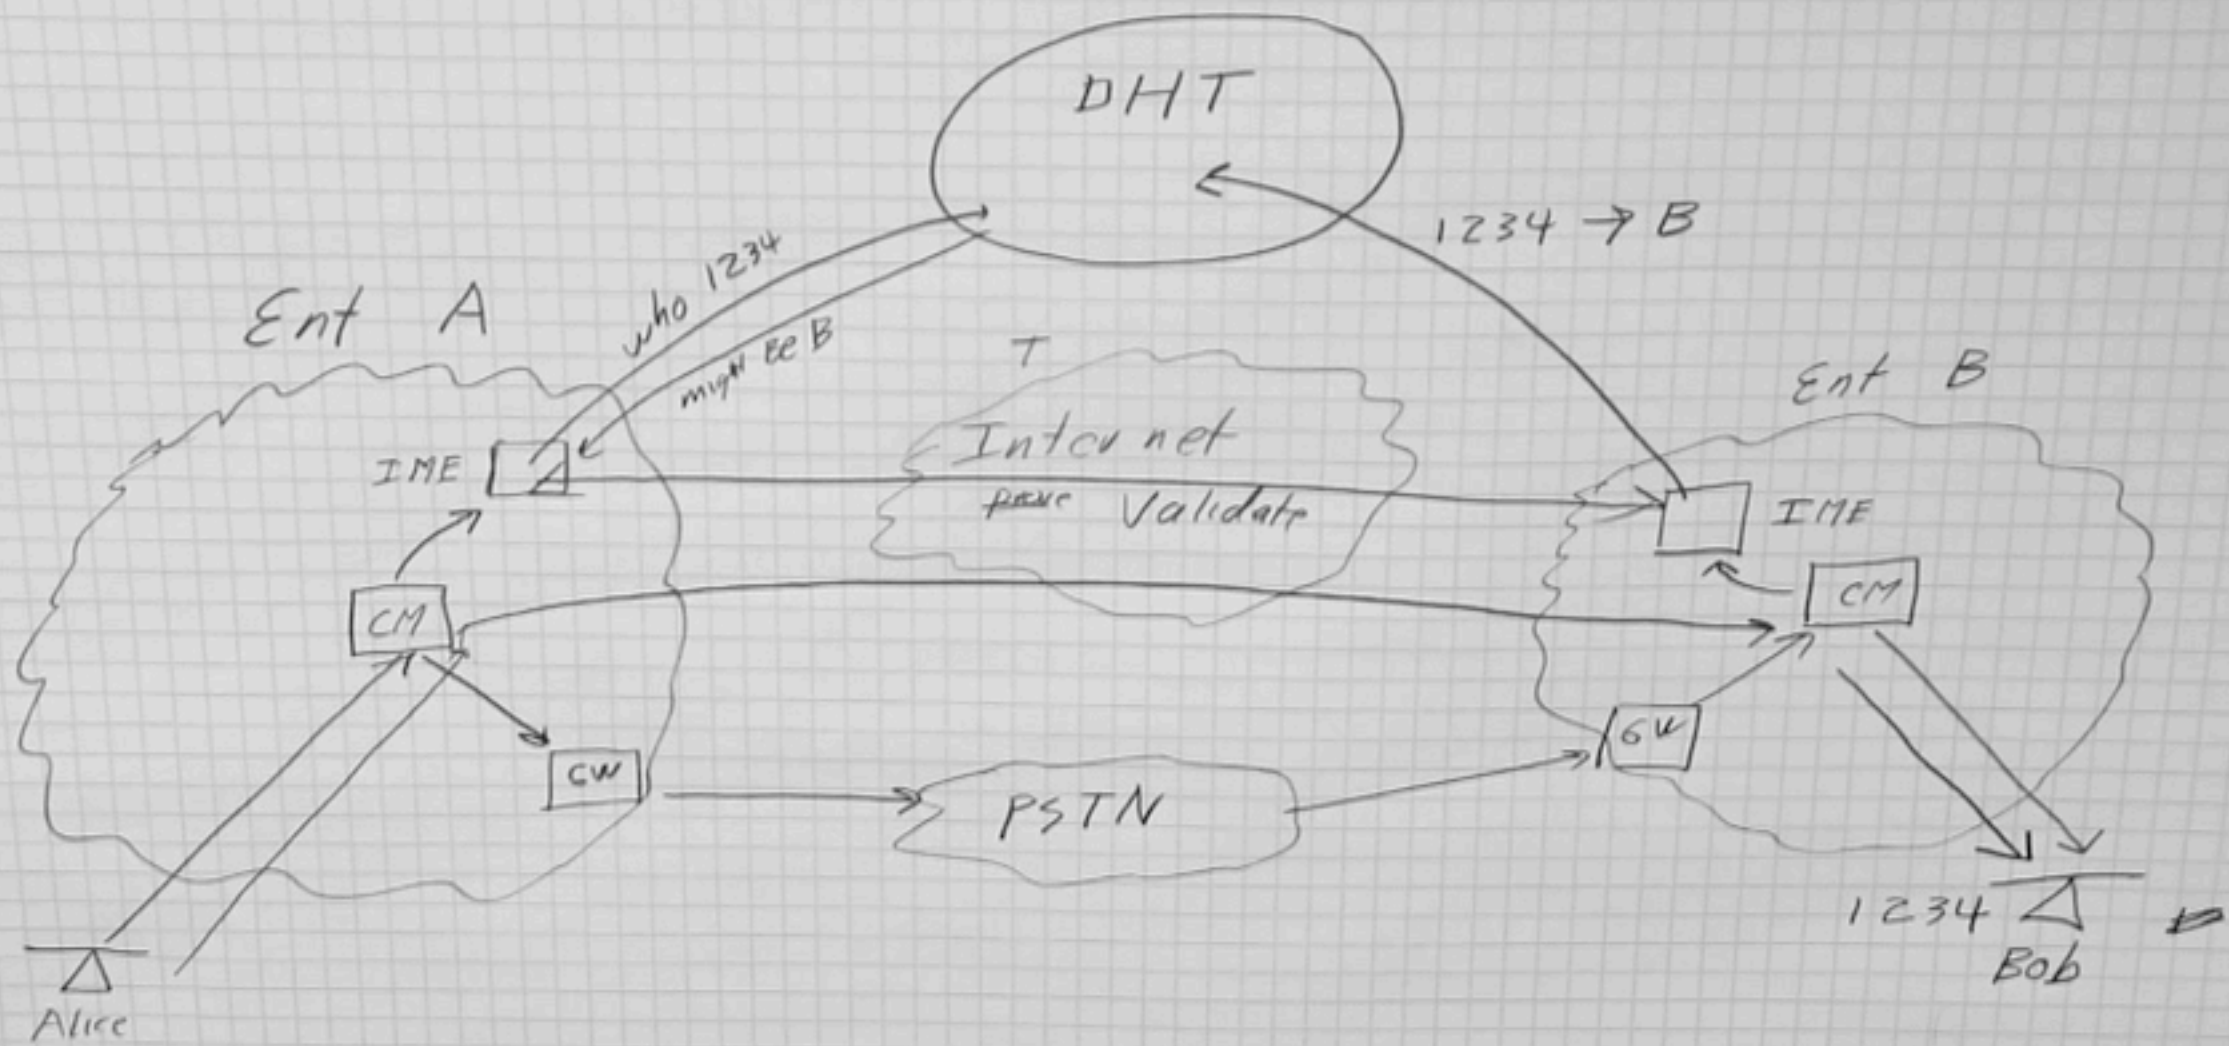

# Back to the problem

# Properties

- Decentralized incremental deployment
- Bootstrap using PSTN forward routing
- Gradual discovery of phone to domain mapping
- Use validation to build up mappings instead of delegated trust

# Proposal for New Working Group

The IETF should create a WG to develop standard track protocols to:

Allow call controller (PBX, Phones, Call Agents, Proxies) to organically build up a validated mapping of phone numbers to target domains.
