

Policies Migration

Presenter: Yingjie Gu

Background Introduction

- Cloud Computing
 - Server Virtualization
 - Storage Virtualization
- VM Migration, in order to
 - Make full use of idle resource
 - Decrease CAPEX & OPEX, energy-saving
 - Traffic optimization and load balancing
 - Increase service availability
- Storage Migration, in order to
 - Traffic optimization
 - Quick response

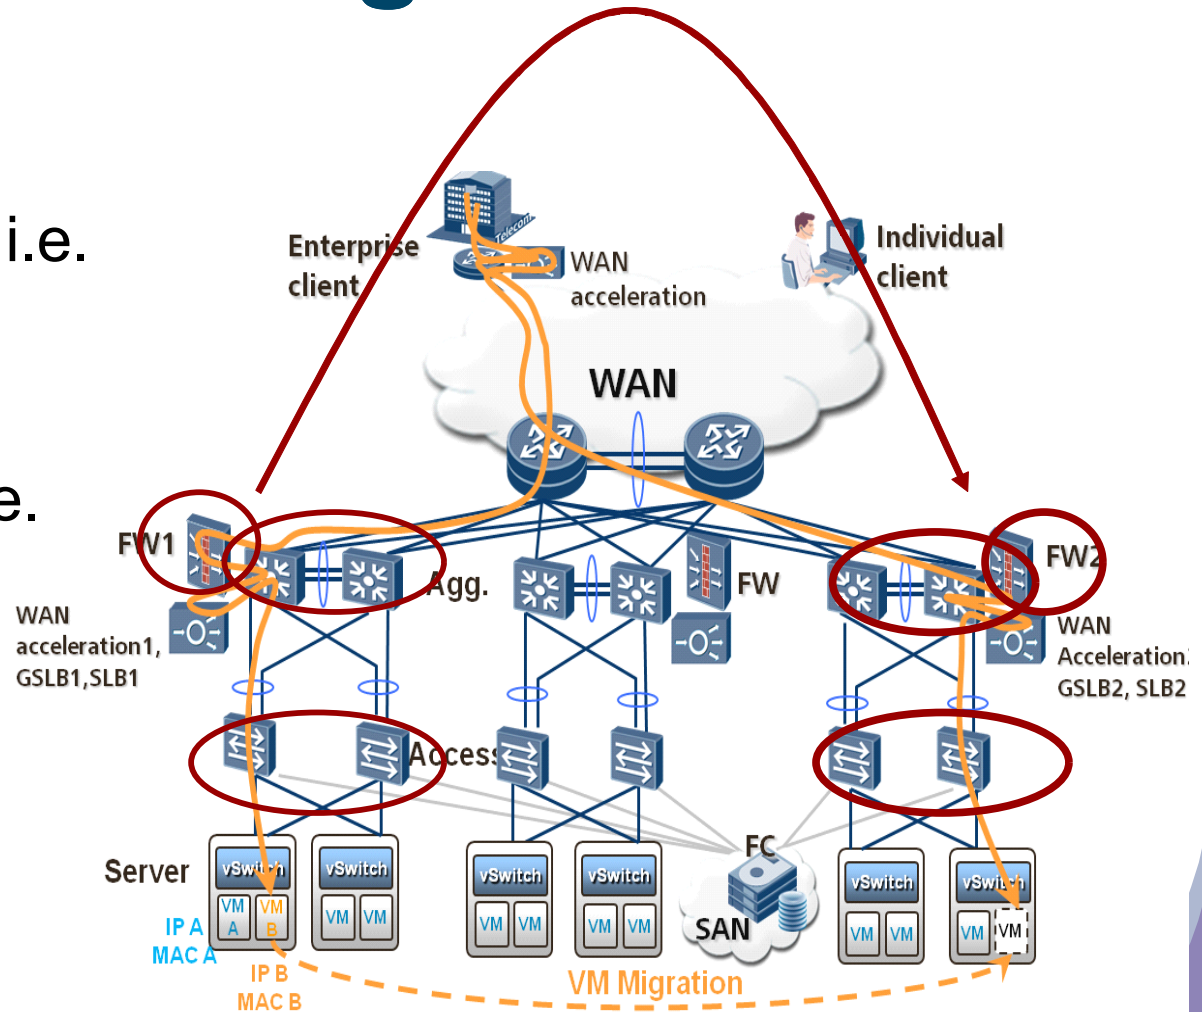

In-site and Between-sites Migration

- Most current VM migration is in-site migration, in which
 - old and new VMs use shared storage
 - L2 Connectivity is guaranteed
- Strong requirements in between-sites migration, together with storage migration, in order to enable
 - Resources-effective
 - DC consolidation/expansion/migration
- Additional technologies to guarantee L2 connectivities between DCs, which is out of scope of this problem statement.

Policies Migration

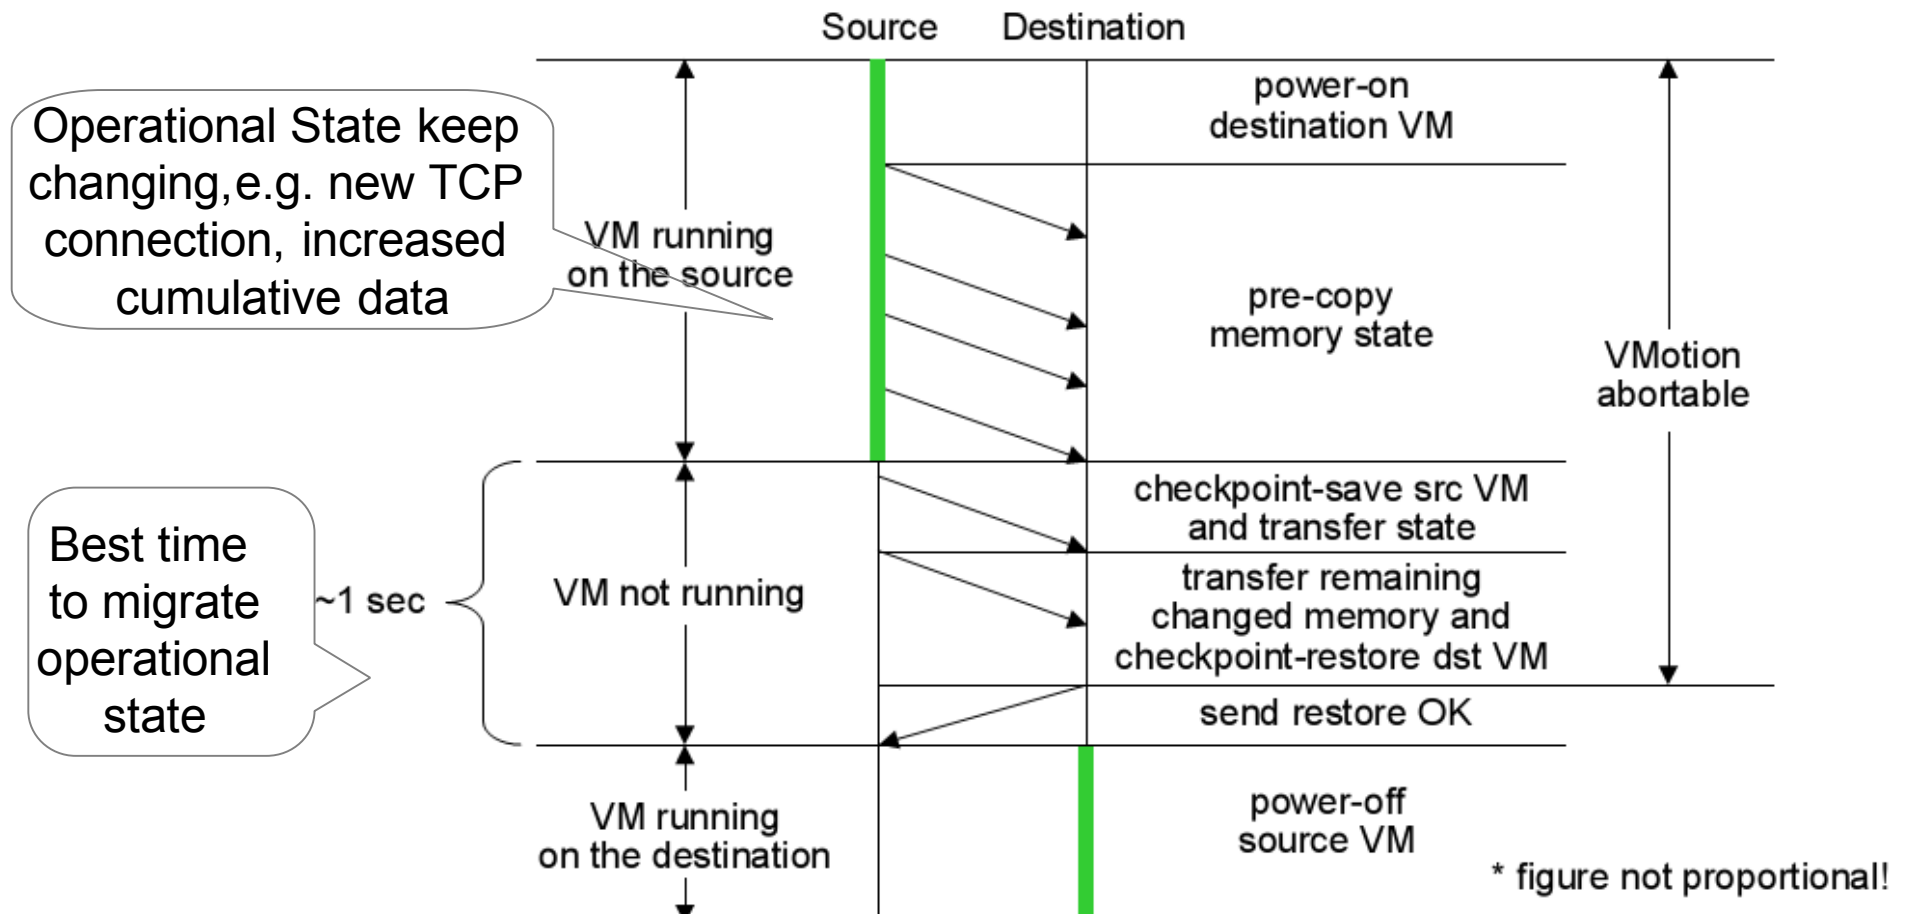

Policies include:

- Configuration State, i.e. static policies configured by manager.
- Operational State, i.e. dynamic policies generated during service running.
 - TCP State
 - Dynamic ACLs
 - Cumulative Data
- We focus on operational state.

Considerations-WHEN?

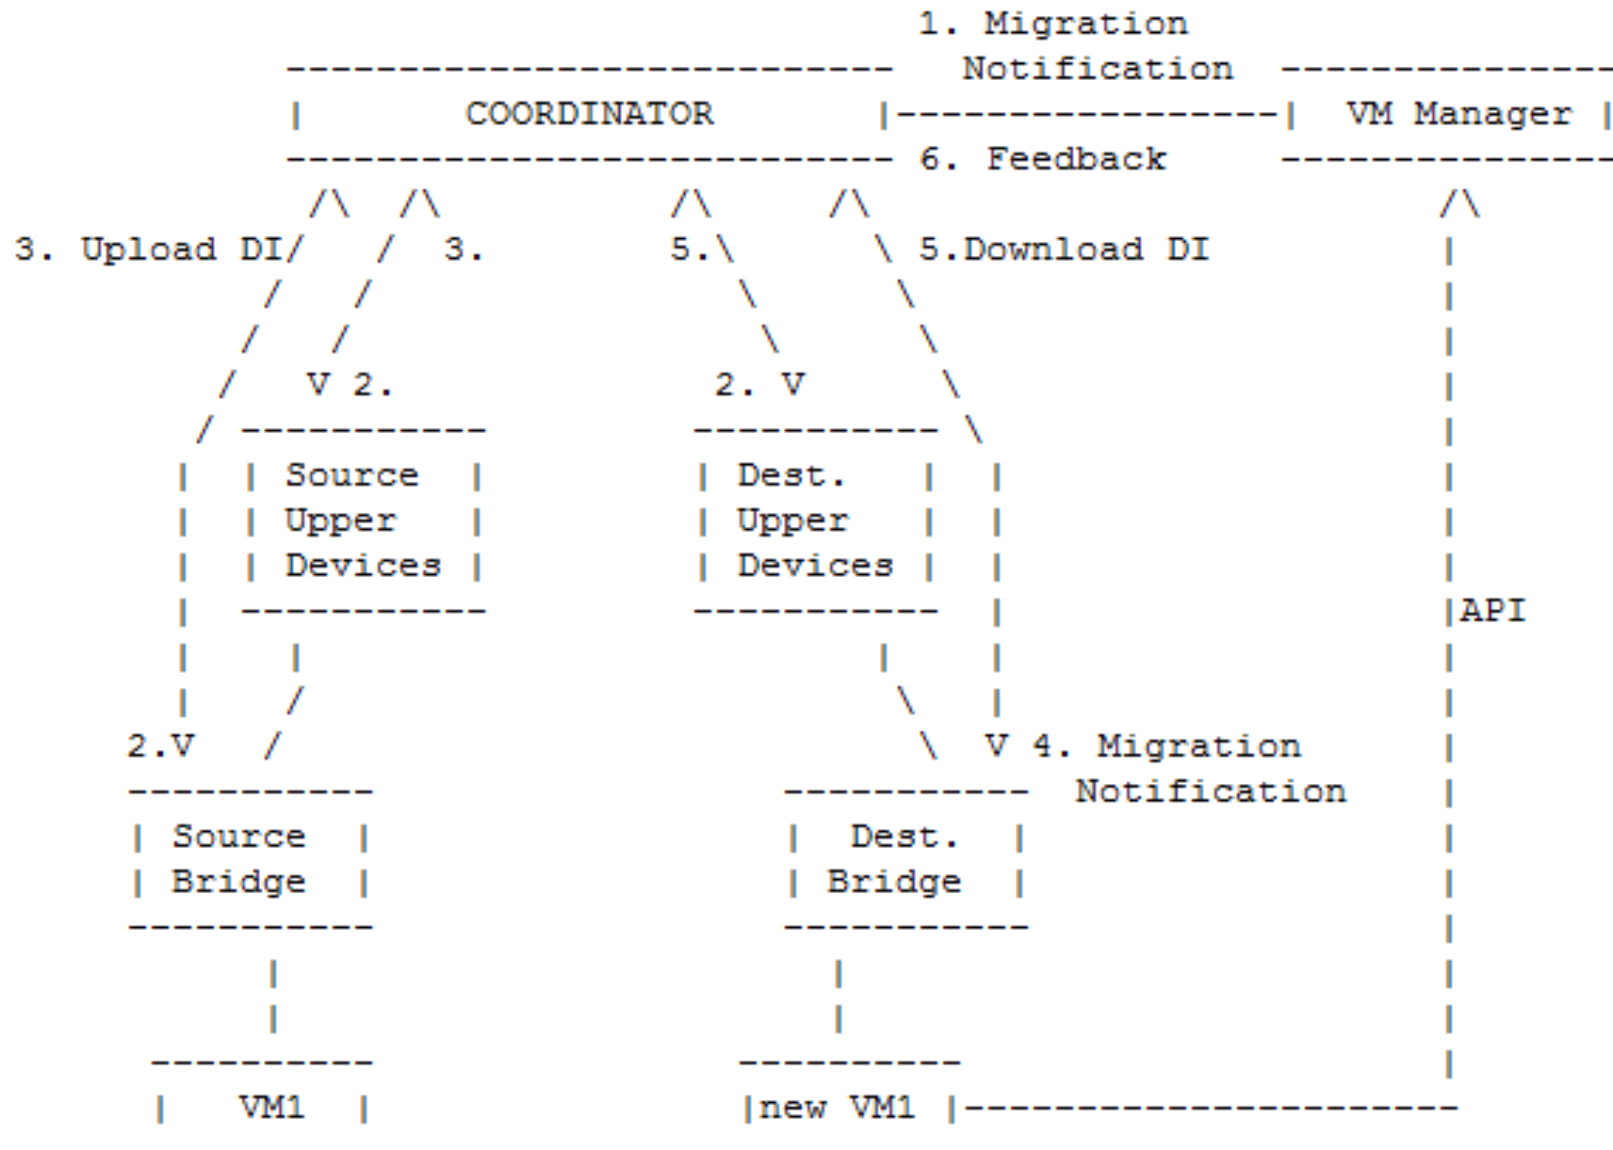

- WHEN: VM migration may take minutes even hours, during which operational state could keep changing, e.g. new TCP connection is established, or sequence number increased. 'VM-not-running' is the best period to migrate Dynamic Information.

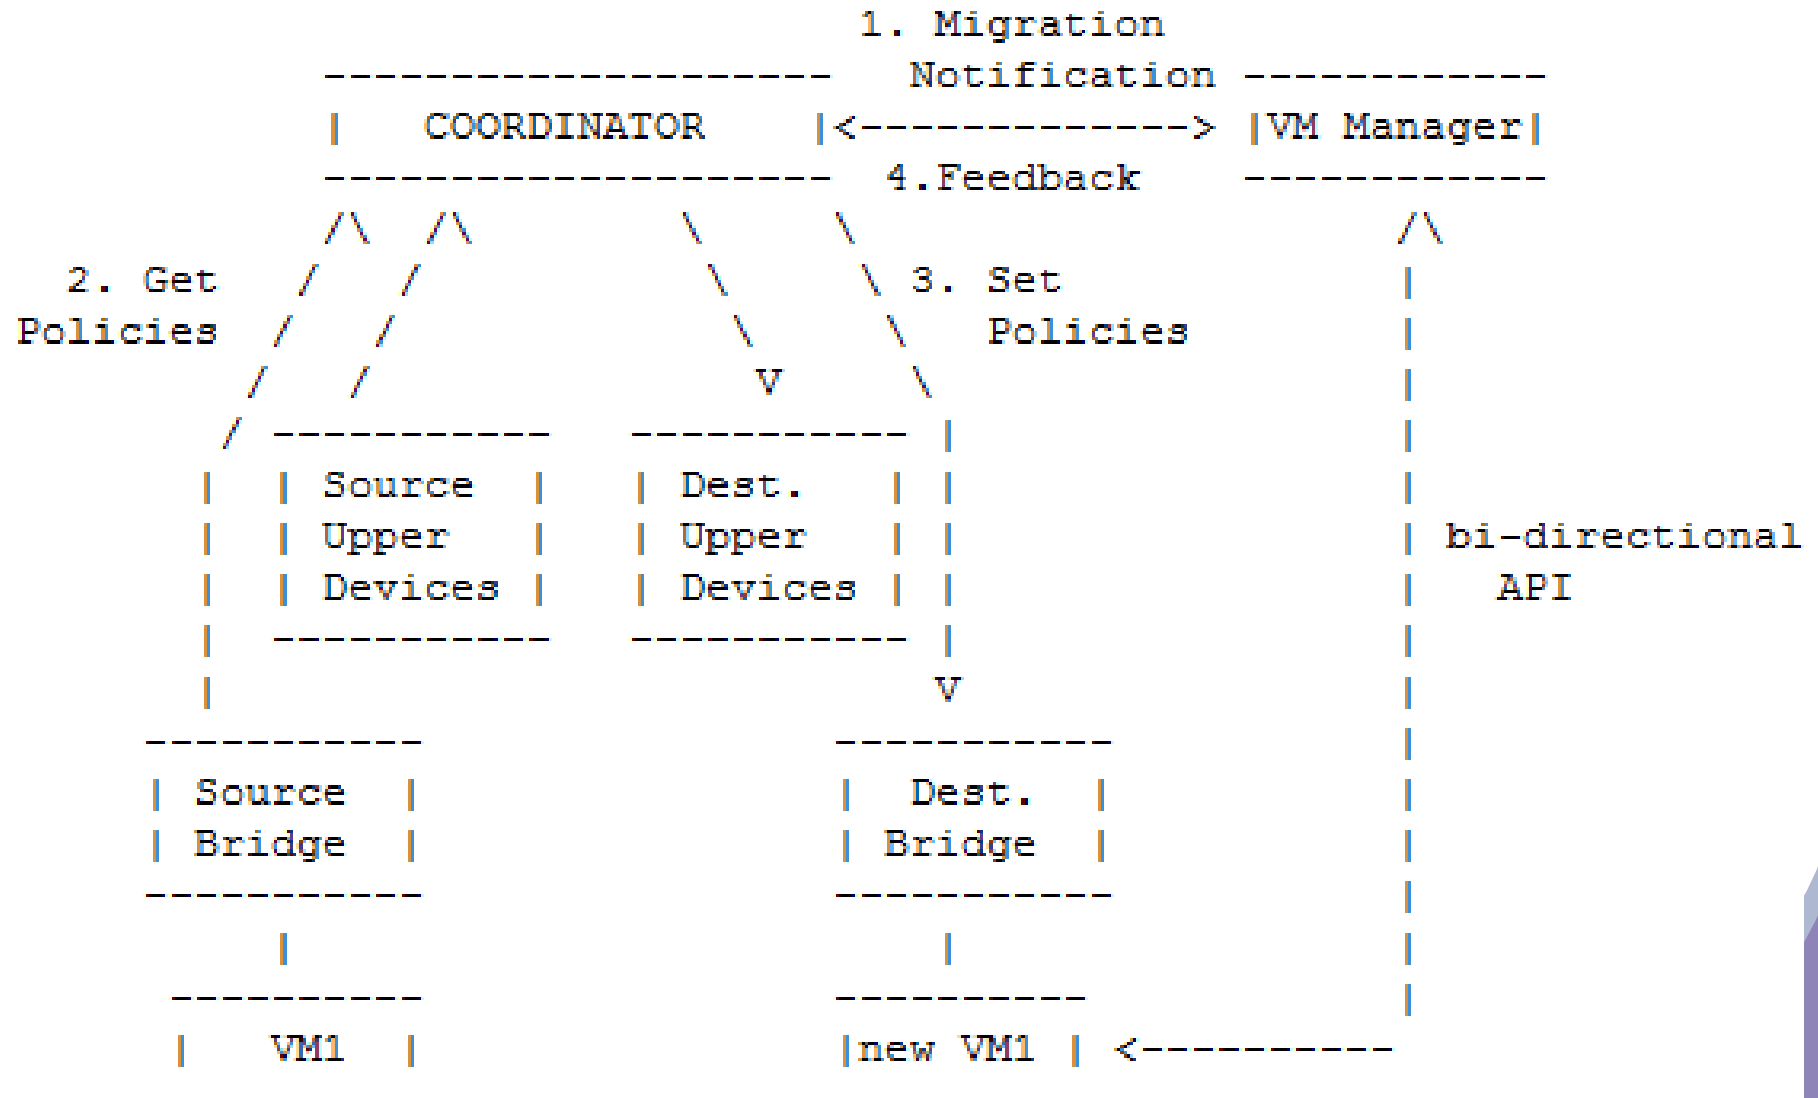

Considerations-WHERE?

- Need to learn where there are operational states that need to be migrated.
- Also need to learn two ends of the migration, i.e. source and destination network devices.
- The operational state migration is not definitely one-to-one model. Since network architecture could be asymmetrical, so that could also be multiple-to-one and one-to-multiple

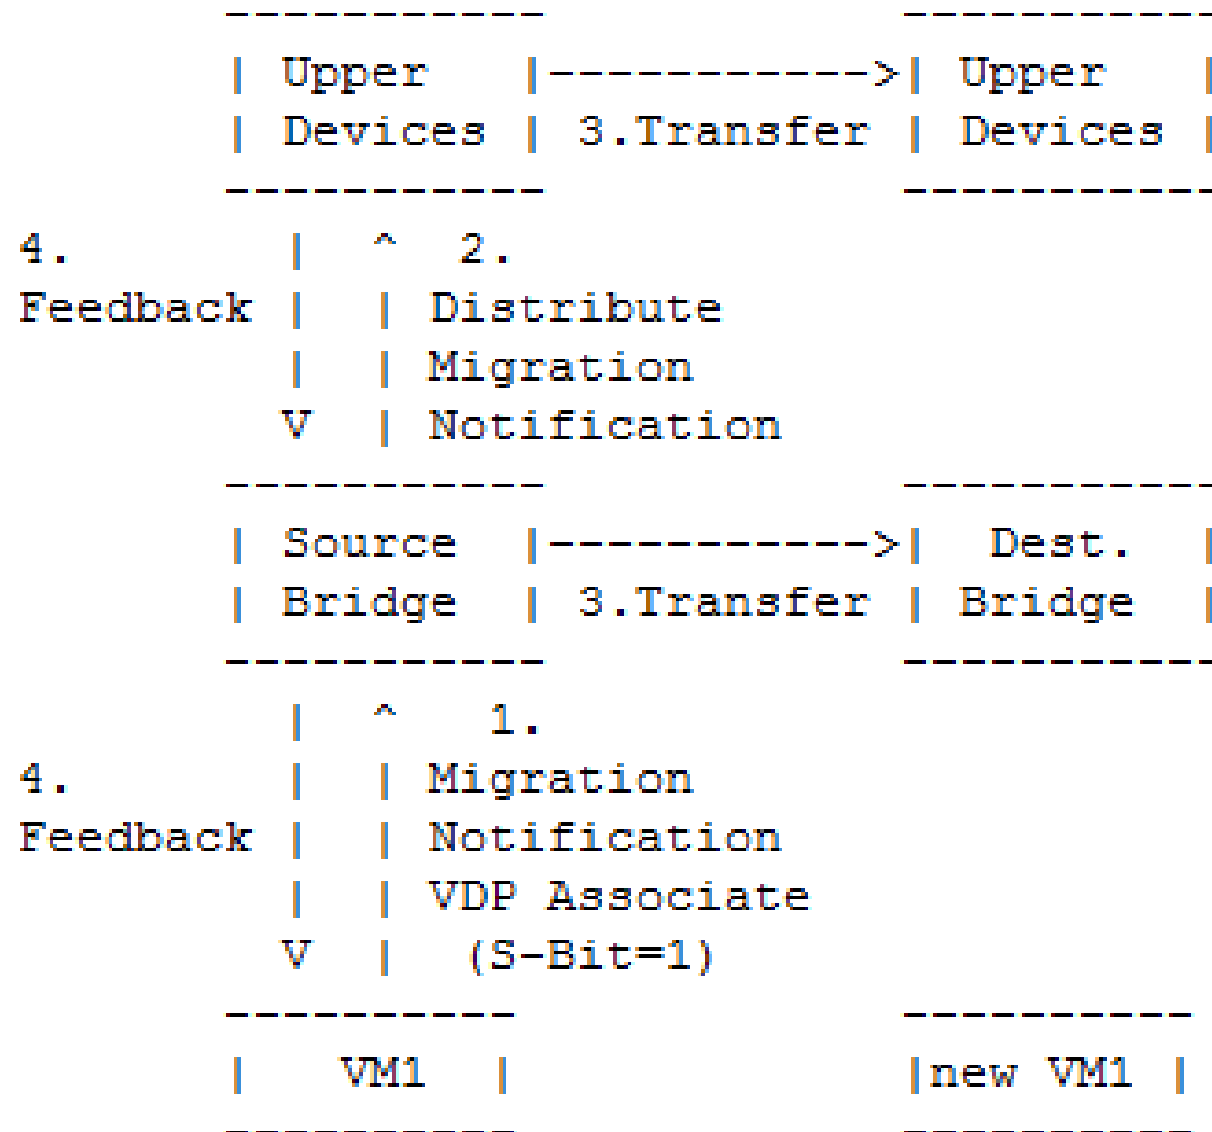

Potential Solution-1

Potential Solution-2

Potential Solution-3

What can be done in TSV Area

- Migration Notification from COORDINATOR to network devices
- Policies Transferring between network devices and COORDINATOR
- According to the final solution, we may also need cooperation between OPSA and TSV to define the communication between COORDINATOR and network manager for Notification and Feedback.

Q&A

Gap Analysis

Dynamic Policy Migration Requirements	Whether Satisfied by MIDCOM	
Notifies accurate migration time to devices	No	New Feature
Mutual authentication	Yes	Could Reuse MIDCOM
Capability negotiation	No	New Features
Dynamic policy transferring	No	
Configure dynamic policy on destination devices	No	
Delete dynamic policy from source devices (how & when)	No	
Peer-to-peer interaction	Yes	Could Reuse MIDCOM
Peers-to-peer interaction	Yes	
Peer-to-peers interaction	Yes	
Interaction atomicity	Yes	
Notify failure and reply reason	Yes	
Symmetric architecture	Yes	
Asymmetric architecture	No	New Features
Between two different Data Center domains	No
